                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        molecules or HFF1-SUMO-1 complex modulators. md71-hypoxia responsive element (HRE) binding molecules or antisense nucleic acid molecules and SUMO-1 binding molecules or antisense molecules are useful for treating subject having or at risk of developing haematologic malignancy or MDR (e.g. a lymphoid disorder or a myeloid disorder). The lymphoid disorders include lymphocytic leukaemia or chronic lymphoproliferative disorders e.g. lymphoma, myeloma or chronic lymphoid leukaemia, e.g. angiogenic myeloid metaplasia, essential thrombocythaemia or polycythaemia vera. The invention is used in gene therapy. The present sequence is an antisense oligo targetted to HRE in the mdr1 gene (mdr1-HRE) to inhibit its expression. This oligo is used in the exemplification of the invention
                         Treating a subject (at risk of) havi multidrug resistance, e.g. lymphoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; haematologic malignancy; multidrug resistance; MDR; SUMO-1; hypoxia inducible factor-1; small ubiquitin-like-modifier; HIF-1; lymphoid disorder; chronic lymphoproliferative disorder; lymphoma; myeloid disorder; lymphocytic leukaemia; thrombocythaemia; myeloma; angiogenic myeloid metaplasia; myeloid leukaemia; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of treating a subject having or at risk of developing a haematologic malignancy or multidrug resistance (MDR). The method involves administering hypoxia inducible factor-1 (HIF-1) binding molecules or small ubiquitin-like-modifier (SUMO)-1 binding molecules or small ubiquitin-like-modifier (SUMO)-1 binding molecules or antisense modulators. mdr1-hypoxia responsive element (HRE) binding molecules or antisense molecules are useful for treating a subject having or at risk of developing haematologic malignancy or MDR (e.g. a lymphoid disorder or a myeloid disorder). The lymphoid disorders include lymphocytic leukaemia or chronic lymphoproliferative disorders e.g. lymphoma, myeloma or chronic lymphoid leukaemia. The myeloid disorders include chronic or acute myeloid leukaemia, e.g. angiogenic myeloid metaplasia, essential thrombocythaemia or polycythaemia vera. The invention is used in gene therapy. The present sequence is human mdr1
The present invention relates to a standardized polynucleotide system, which comprises at least one carrier nucleic acid, at least 3 oligonucleotides, as primers and target-gecific, fluorescently labeled probe and optionally at least one set of stabilized controls (standard RNA or DNA) of known concentration and instructions. The system comprise any of 20 sets of one control, two primers and one target-specific probe
                                                                                                                                                                                                            Claim 1; Page 12; 38pp;
                                                                                                                                                                                                                                                                                                      Standardized polynucleotide system, useful for quantitative, determination of nucleic acid, comprises stabilized standard
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             28-FEB-2002; 2002DE-01009071.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     28-FEB-2002; 2002DE-01009071.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The standardized polynucleotide system can be used for quantitative, real -time detection of target nucleic acids, especially analysis of genes or gene products, e.g. for individualized medical diagnosis, in veterinary medicine, functional genomics, clinical pharmacology, pharmacogenetics, pharmaceutical testing, analysis of food or environmental samples and also for ultra-sensitive detection of proteins by immuno-PCR. The present sequence is a polynucleotide used in the system of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 594 BP; 170 A; 125 C; 131 G; 0 T; 168 U; 0 Other;
                                                                                                                                                                                                                                                                         This gene is used as an example of a target DNA in a method for the amplification of nucleic acid sequences in a mixture using various DNA probes/primers. The method may be used to detect a mutation or allele ithe target, e.g. that that causes a genetic disease. (Updated on 25-MAI 2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enzymatic amplification of target nucleic acid sequences in a mixt.detect a mutation or allele in the target, e.g. that causes a genetic

                                                                                                                                                                                                                                                                                                                                               This gene is used as an example of a target DNA in a method for the amplification of nucleic acid sequences in a mixture using various DNA probes/primers. The method may be used to detect a mutation or allele the target, e.g. that that causes a genetic disease. (Updated on 25-MA) 2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                modified copies -
or allele(s).
                                                                                                                                                                                                                                                                                                                                                                                                                                          Enzymatic amplification of target nucleic acid sequences to form exact or modified copies - has increased fidelity and can identify point mutations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   27-JAN-1993;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents the multidrug resistance gene (MDR-1) amplified CC by the primers shown in AAT43320 and AAT43321. This sequence can be used CC as a target nucleic acid (TNA) sequence contained in a nucleic acid or CC mixture of nucleic acid (TNA) sequence contained in a nucleic acid or CC mixture of nucleic acids while avoiding strand displacement by CC polymerase. The method comprises using three primers, one complementary. CC to a first segment of the TNA, a second complementary to a second segment composition of the first primer. And a third which is composition of the first primer. The first two primers are hybridised to the CC TNA, and a fused amplification product is created from the TNA using these two primers. The fused product is dissociated, and hybridised to the third primer, which is then extended. The extended modified CC these two primers are ligated. Each of the primers may be labelled using a CC thought of the product is hybridised to the first two primers, and these camplification product is product to the first the presence of a mutation or allele by detecting whether the labelled primer is CC contained within the fused amplification product or the extended camplification product. The method of the invention combines certain CC aspects of ligase chain reaction (LCR) and polymerase chain reaction (CC primers needed, and the fact that the entire TNA sequence does not need compared to LCR due to the reduced number of compared to LCR due to the reduced number of comparers and the fact that the entire TNA sequence does not need to be compared to LCR due to the reduced number of comparers and the fact that the entire TNA sequence does not need to be compared to LCR due to the reduced number of comparers to the compared to LCR due to the reduced number of comparers to the compared to LCR due to the reduced number of comparers to the compared to LCR due to the reduced number of comparers to the comparers to t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                           Inhibiting expression of target genes, useful by introducing into cells two double-stranded to the target.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to inhibiting expression of a target gene (I) in a cell by introducing an inhibitory RNA (dsRNA1) having a double-stranded structure of at most 49 consecutive bases. At least part of one strand (as1) of dsRNA1 is complementary to (I) and at least one end of dsRNA1 has an overhang of 1-4 nucleotides. The method is used to inhibit the expression of a wide range of genes, e.g. oncogenes, cytokine genes etc. in humans, also genes in Plasmodium or in viruses or viroids that are pathogenic for humans, animals or plants. Introducing an overhang into dsRNA greatly increases effectiveness for inhibiting gene expression, both in vivo and in vitro and also increases stability and thus the effective concentration inside the cell. The present sequence is that of

The invention relates to inhibiting expression of a target gene in a cell CC by introducing at least two oligoribonucleotides (dsRNAI and II), both CC with a double-stranded (ds) structure of at most 49 sequential nucleotide CC pairs. At least part of one strand (S1, S2) of the ds structures in each CC of dsRNAI and II are complementary to regions in the target gene. The CC method uses antisense inhibition of gene expression using double stranded CC RNA inhibition (RNAi). The method is particularly used to treat tumours CC or infections, especially by Plasmodium or viruses/viroids (pathogenic on CC of expression than known methods using a single dsRNA, even at very low CC concentrations. When dsRNA has at least one unpaired nucleotide at the CC end, stability (and thus effective concentration in the cell) is improved and efficiency can be increased further by pretreating the cells with CC interferon. The present sequence is that of a target DNA of the invention very
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                      This invention describes a novel method for inhibiting expression of a target gene by introducing into the cell that contains the target gene ileast one oligoribonucleotide (dsRNAI) that and double-stranded (ds) structure of not more than 49 consecutive nucleotides (nt), where at least a segment of one strand of the ds structure is complementary with the target gene and the cells are treated with interferon before introduction of dsRNAI. The method is used to inhibit expression of target genes, particularly oncogenes, cytokine genes, Id (not defined)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligoribonucleotide; interferon; oncogene; cytokine; Id; developmental;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 3840 BP; 1130 A; 738 C;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     interferon greatly increases the extent to which dsRNA can inhibit expression of the target genes, and the effect is even greater when dsRNA are modified to increase their stability. ABX09936-ABX10075 represent gene fragments used to illustrate the method of the invention
                                               The invention relates to a method for inhibiting expression of a target gene (ABL91658-ABL91797) in a cell by introducing at least one oligoribonucleotide that has a double-stranded structure consisting of at most 49 sequential nucleotide pairs, with at least part of one strand complementary with the target gene and has at least part of one strand retranded segment of 1-4 nt. The method provides oligoribonucleotides for antisense inhibition of gene expression useful e.g. for treating tunours but the oligoribonucleotides may also be directed against genes present in pathogens (e.g. Plasmodium or viruses/viroids, pathogenic on humans, animals or plants) or against cytokine, Id, developmental or prion genes. The method provides more effective inhibition of gene expression than use of known oligonucleotides, probably because the unpaired overhang increases stability and thus intracellular concentration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 3840 BP; 1130 A; 738 C; 957 G;

                                                                                                                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to presumption of the side effect of at least one immunosuppressant selected from tacrolimus and cyclosporin in which if the 267th base in the position of MDRI gene in the encoding region of the cDNA sequence is guanine, adenine or thymine, is investigated. The method is used for the presumption of the side effect of an immunosuppressant. The present sequence is that of the MDRI encoding cDNA immunosuppressant.
                              Human wild-type multidrug resistance-1 (MDR-1) cDNA.

cc resistance protein MDR-1. MDR-1 is a transmembrane efflux pump, cc responsible for the export of drugs from cells, particularly cancer cells. Wild-type MDR-1 shows increased resistance to etoposide and cc (AAY58187) where the Gly at position 185 is replaced by Val. The cinvention relates to transducing haematopoietic stem cells with nucleic cacid encoding an MDR protein and culturing the modified cells. The cmodified haematopoietic stem cells are useful in bone marrow transplantation (to reconstitute haematopoietic systems in patients who chave undergone chemotherapy or radiation therapy) and in ex vivo gene cells, e.g., thalassaemia, Gauchier's disease, sickle cell anaemia or cells, e.g., thalassaemia, Gauchier's disease, sickle cell anaemia or cells, e.g., thalassaemia, Gauchier's disease, sickle cell anaemia or cleukaemia. The modified cells can also be used to identify factors convolved in regulating proliferation and differentiation in haematopoietic stem cells. Haematopoietic stem cells that express MDR-1 cwill be protected against chemotherapeutic agents, so can be engrafted convolved in the patient is undergoing chemotherapy. Expansion of (rare) the modified cells provides sufficient cells to permit standard convolved in the patient is undergoing chemotherapy. Expansion of (rare) capansion of haematopoietic stem cells by at least 10-fold compared with a maximum of 4-fold in known procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CDS

                                                                                                                                                                     CC resistance protein MDR-1, where the the Gly residue at postion 185 of the cefflux pump, responsible for the export of drugs from cells, particularly CC cancer cells. The wild-type MDR-1 shows increased resistance to etoposide and decreased resistance to vinca alkaloids compared with the G185V CC mutant. The invention relates to transducing haematopoietic stem cells CC with nucleic acid encoding an MDR protein and culturing the modified with nucleic acid encoding an MDR protein and culturing the modified CC cells. The modified haematopoietic stem cells are useful in bone marrow CC transplantation (to reconstitute haematopoietic systems in patients who CC have undergone chemotherapy or radiation therapy) and in ex vivo gene CC cells, e.g., thalassaemia, Gauchier's disease, sickle cell anaemia or CC leukaemia. The modified cells can also be used to identify factors CC involved in regulating proliferation and differentiation in haematopoietic stem cells that express MDR-1 CC will be protected against chemotherapeutic agents, so can be engrafted CC while the patient is undergoing chemotherapy. Expansion of (rare) thaematopoietic stem cells to permit standard CC biochemical analysis. Overexpression of MDR-1 allows cytokine-driven cCC expansion of haematopoietic stem cells by at least 10-fold compared with cCC a maximum of 4-fold in known procedures

The isolated stem cells may be used in the treatment of diseases such as muscular dystrophy, degenerative liver disorder, myocardial infarction, Parkinson's disease, degenerative disorders of the brain, and for trissue regeneration or replacement. Haematopoietic cells can be used in bone marrow transplants (e.g., for treatment of leukemia) and for ex vivo gene therapy for treating blood diseases such as sickle cell anemia and thalassemia. The stem cells can also be used as cell targets in gene therapy protocols. The present sequence represents a sequence related to the BCRP for which no relevant

The isolated stem cells may be used in the treatment of diseases such as muscular dystrophy, degenerative liver disorders of the brain, and for tissue regeneration or replacement. Haematopoietic cells can be used in bone marrow transplants (e.g., for treatment of leukemia) and for ex vivo gene therapy for treating blood diseases such as sickle cell anemia and thalassemia. The stem cells can also be used as cell targets in gene therapy protocols. The present seguence represents a seguence related to the BCRP for which no relevant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying a stem cell, for treating e.g., muscular dystrophy, myocardial infarction, Parkinson's disease, or neurodegenerative disorders, comprises detecting the expression of an ATP transport protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Stem cell; ATP transport protein; ATP-binding cassette; antiparkinsonian; hepatotropic; neurodegenerative; cytostatic; antianemic; muscular; BCRP; cardiant; gene therapy; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   was constructed using the Lambda Zap Express/Gigapack cloning kit (Stratagene cloning systems). CDNA synthesis was carried out using an oligo (dT) primer for the reverse transcription of 5ug of mRNA and the library was constructed by directional cloning EcoR1-Xho1 based on manufacturers instructions. An insert:vector ligation ratio of 1:5 was chosen as most optimum. The lambda library was packaged with Gigapack III gold packaging extracts and plated on the E. coli cell line XLI-Blue
